Wageningen Environmental Research
(WENR), Wageningen, the Netherlands

Operationalizing the increase of water use efficiency and resilience in irrigation

- ▶ Challenge- I) Increasing the efficiency and resilience of water uses
 - ▶ Sub-topic- I.a. Efficiency issues include the development of:
 - i. Innovative water use systems and practices, including precision irrigation technologies (e.g. models, sensors, ICT);
 - ▶ (Sub-topic- I.b. Resilience to climatic variability)

Focus

- ▶ Challenge- I) Increasing the efficiency and resilience of water uses
 - ▶ Sub-topic- I.a. Efficiency issues include the development of:
 - i. Innovative water use systems and practices, including precision irrigation technologies (e.g. models, sensors, ICT);
 - ▶ (Sub-topic- I.b. Resilience to climatic variability)

Consortium

Funding : 920 k€ (Total 1236k€)

OPERA - Objectives

- 1) To identify specific market driven, **farmer demands**
- 2) To identify operational means to anticipate **climate variability** and critical moments of water scarcity.
- 3) To identify the most adequate combination of **soil sensors, plant-based sensors, remote sensing, weather forecast and simulation models** in irrigation scheduling.
- 4) To identify ways for operationalizing the **upscaling** at the territory scale information allowing a better management of water scarcity and drought.
- 5) To **integrate experience** in operationalizing precision irrigation from various climatic zones in Europe and South Africa to identify the best applicable service models.

Work Packages

Stakeholders oriented

WP1 - Identifying sector needs to increase resource use efficiency : **Needs**

lead: Evenor Tech, Spain

WP2 - Forecasting water availability and critical water demand : **Innovation**

lead: INRA – EMMAH, France

WP4 - Conceptualization of practical service models for irrigation : **Transfer**

lead: CREA, Italy

WP3 - Guidance for optimal irrigation water strategies (case studies) : **demonstration**

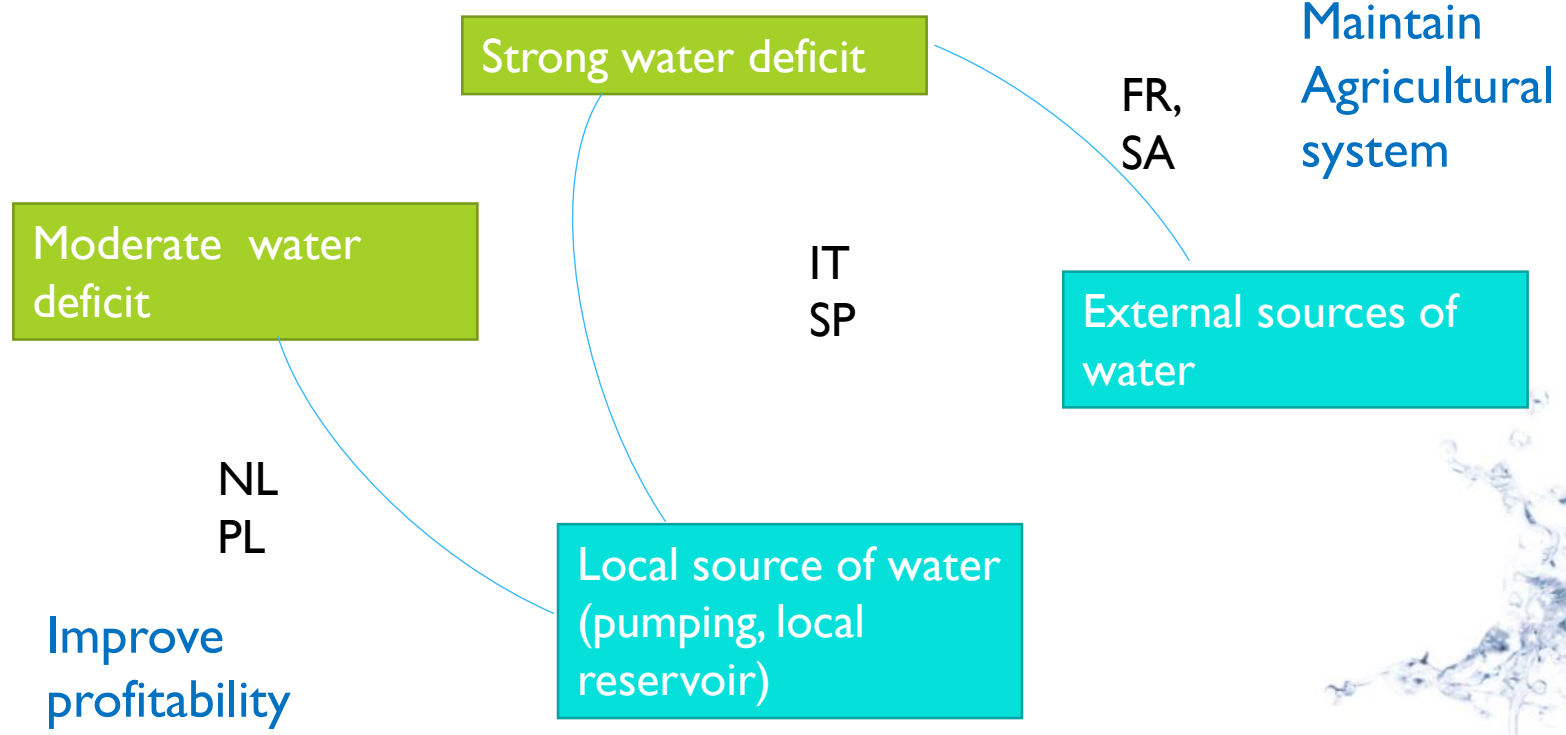

lead: ITP, Poland

Technical oriented

Demand from the farmers

- ▶ Assessment from users : 251 surveys, 2 local workshops, 6 pilots.

Issues linked to irrigation

	FR	SA	IT	SP	PL	NL
Cost (water price, Energy)			(x)	(x)	(x)	
Hydraulic infrastructure (water distribution, irrigation system, reservoirs)	x	x	x	x	x	
Regulation (water sharing between users, administration)	x	x	x	x	x	
Increase water use efficiency	(x)	(x)	x	x	x	x
Reduce labour cost	x		x			

limitations

Case Study	Water efficiency	Adopting alternative crops
Poland	<p>Economic:</p> <ul style="list-style-type: none"> - high investment costs (irrigation equipment, well drilling, water distribution), lack of available catalogue of the best technical and organizational solution <p>Administrative:</p> <ul style="list-style-type: none"> - complexity and time to obtaining water intake permit 	<ul style="list-style-type: none"> - uncertainty of prediction market demands - advice on suitable crops - lack of specific information on water, fertilizer and cultivation requirements
France	<p>Economic:</p> <ul style="list-style-type: none"> - high cost of irrigation control system <p>Technical</p> <ul style="list-style-type: none"> - Lack of trusts in the quality of the delivered information 	
Italy	<p>Without preferences between the proposed factors, stakeholders given the same importance, fear of being more controlled</p> <p>Lack of trusts in the quality of the delivered information</p>	<ul style="list-style-type: none"> - costs - uncertainty of prediction market demands
South Africa	<p>The stakeholders considered themselves highly efficient. However, they mentioned that improving field infrastructure and adapting their irrigation strategies are the best way to improve efficiency</p>	<p>Crops according to the market demands</p>
Spain	<p>Economic:</p> <ul style="list-style-type: none"> - expensive products; investment costs <p>Administrative:</p> <ul style="list-style-type: none"> - Lack of agility by the administration; Little promotion of advisory services by public administration <p>Technical : fear in introducing new technologies</p>	<ul style="list-style-type: none"> - costs - uncertainty of prediction market demands
Netherland	<p>Economic:</p> <ul style="list-style-type: none"> - High prices of good systems 	<ul style="list-style-type: none"> - Costs - uncertainty of prediction market demands

Trust in innovation : the case of SA

Fruitlook – remote sensing

- ▶ **Sophisticated tool :**
 - ▶ Use satellite and weather information to monitor vineyards and orchards in terms of crop growth, crop water-use and leaf nitrogen content
 - ▶ Uses eLEAF's Pixel Intelligence technology (PiMapping®) which combines meteorological, biophysical and satellite data.
 - ▶ Data components are based on SEBAL

- ▶ **Widely available :** Open-access online platform, since January 2012 and covers approximately 200 000 hectares of crops

- ➔ **NOT USED, SOIL MOISTURE PROBES BEING PREFERRED**
 - ➔ Why ?
 - ➔ Increasing the trust by comparing results

Trust in innovation : the case of SA

Fruitlook – remote sensing

- ▶ Lack of trust
- ▶ Lack of understanding (interface, background)

Trust in innovation : the case of SA

m3 water for 943 hectares of plums in Robertson valley

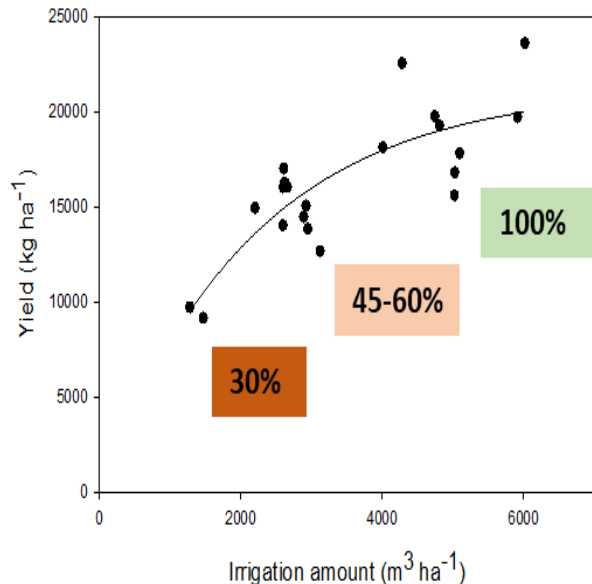

Mapping crop practices and land use (Using Sentinel 2 data)

M6 evaluation

Farm	Nb of field	year	True positive	False positive	Rate of good determination
Boisvert	55	2016	6	0	100%
		2017	10	2	83%
Suffren	47	2016	5	0	100%
		2017	8	3	72%
Aqueduc	23	2016	3	0	100%
		2017	8	0	100%

M2 A novel plant-based method

Conceptual basis

Analogous??

How are we implementing it?

Combination of plant-based sensors and physiological process-based models

M2 : Stomatal conductance as a key information to evaluate plant status

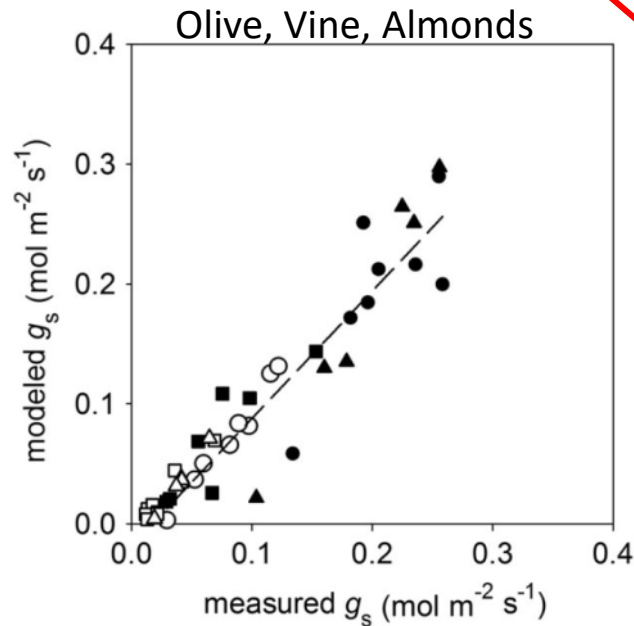

Input variables

- Soil water potential ($\approx \Psi_{pd}$)
- VPD (air humidity)
- PPFD (light)
- [CO₂]
- Temperature

$$g_s = \frac{\chi\beta\tau (\Psi_s + \pi_e)}{1 + \chi\beta\tau R VPD}$$

Parameters

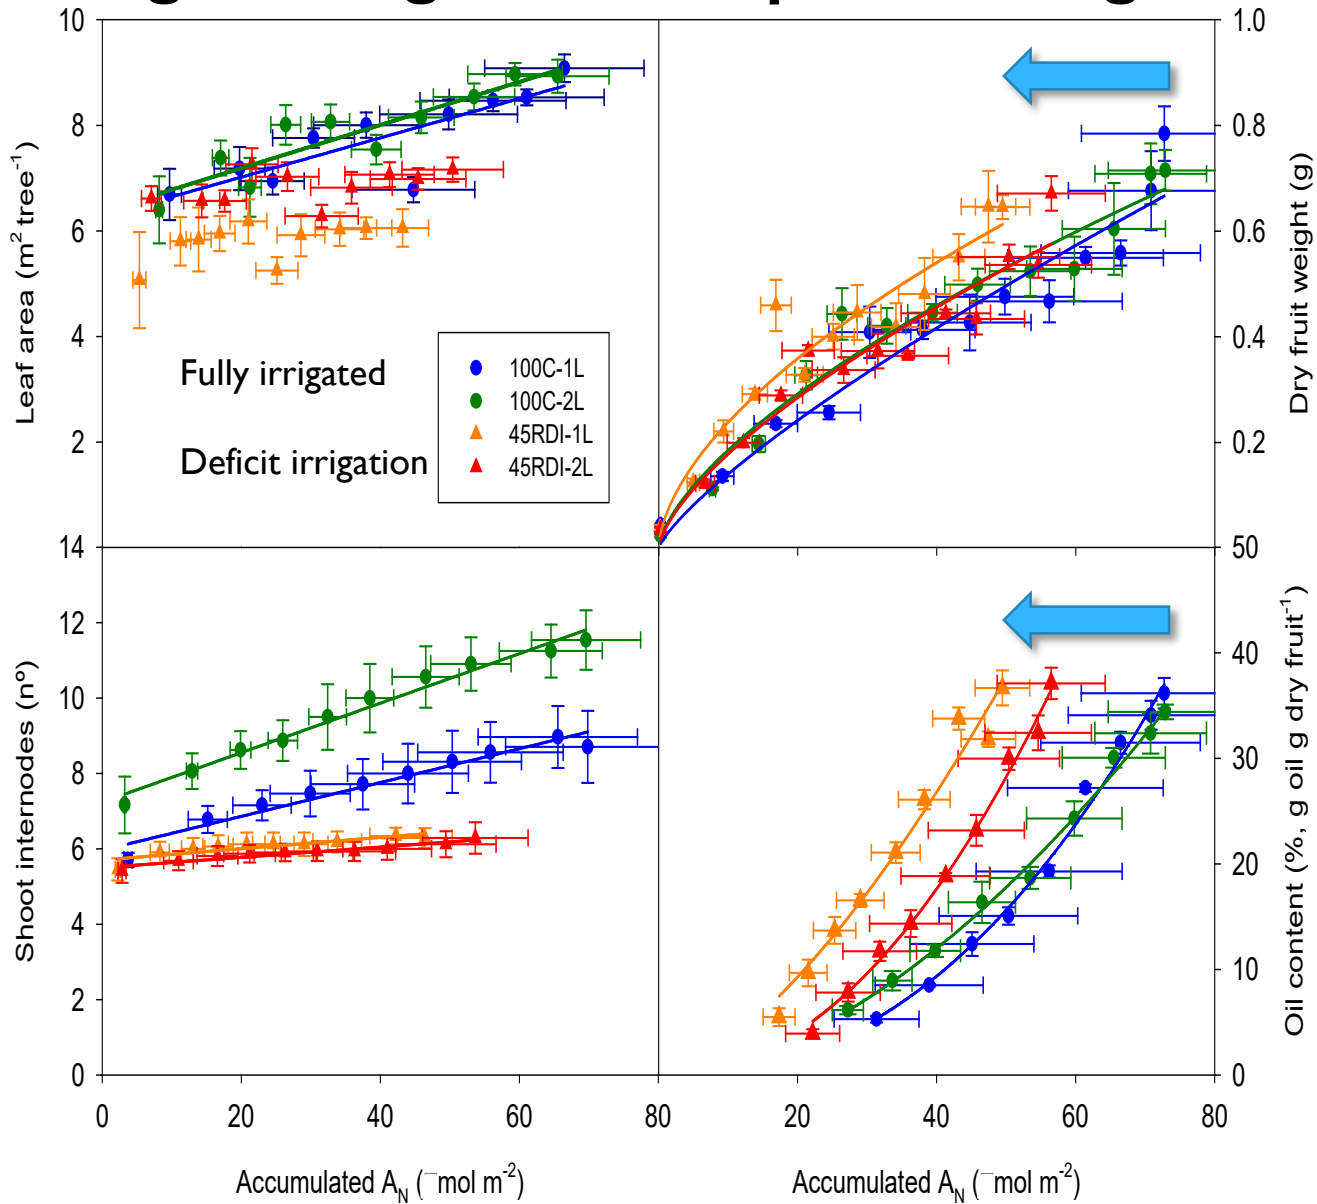

- Plant hydraulic resistance
- Guard cells sensitivity to turgor
- Osmotic pressure

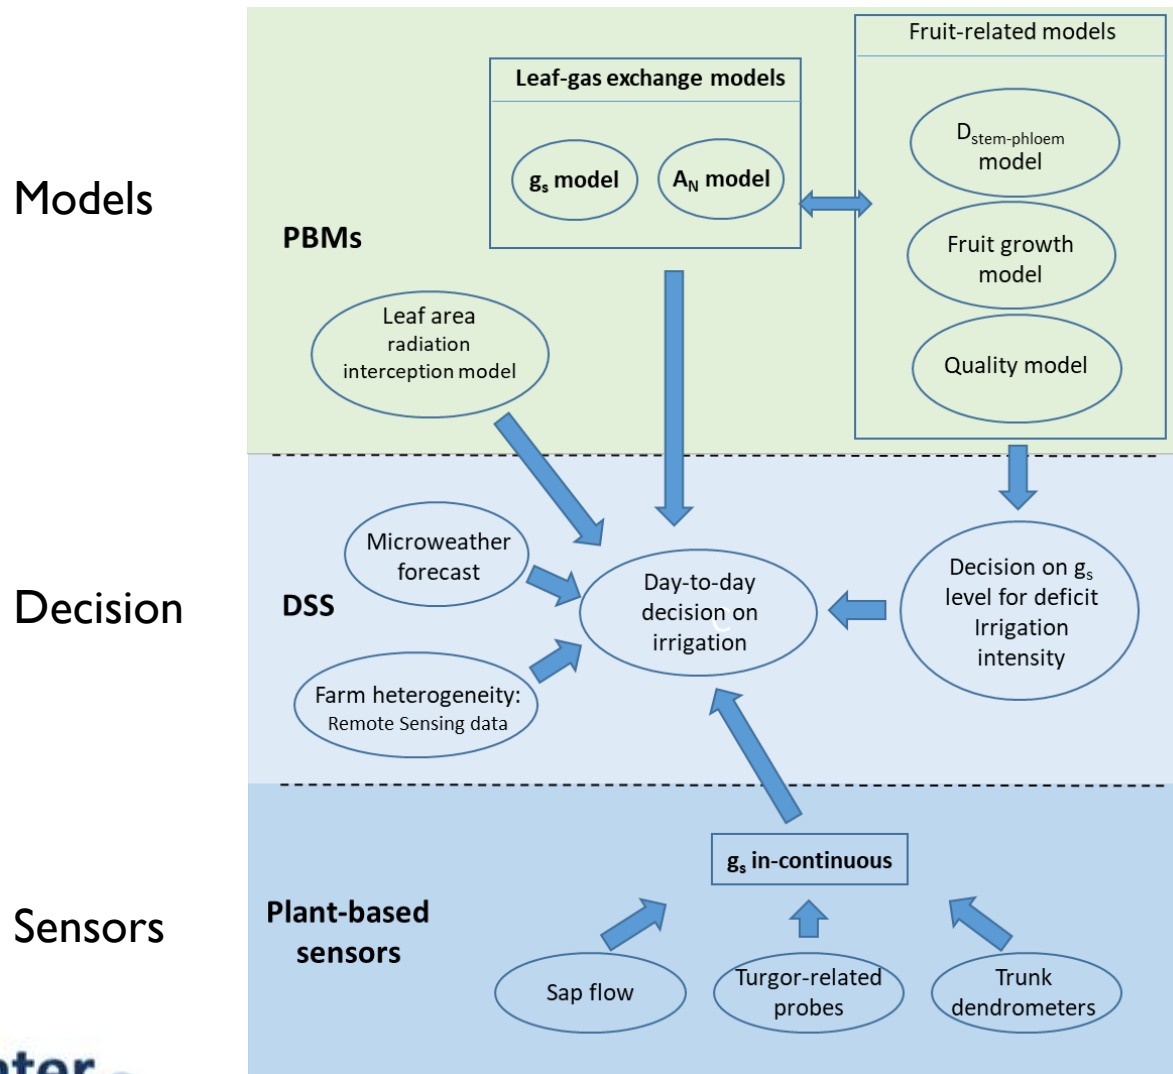

Rodriguez-Dominguez et al. 2016

Vegetative growth

Reproductive growth

M2 : Overall scheme

IMPLEMENTATION

- ▶ Test method and quantify the performances
 - ▶ Define a Benchmark (what is done before OPERA)
 - ▶ Define metrics to assess the method performances
 - ▶ Provide a reference data set showing the interest of the method (difficult to obtain since it requires to manipulate irrigation).
- ▶ Provide guide lines
 - ▶ For the design Irrigation Advisory services based on the tested technologies (Context, issues, methods)

M5 irricrop (tested in Southern Italy)

1. AquaCrop model

2. IRRISAT, an irrigation advisory service based on Sentinel-2 imagery

Benchmark

3. Assimilating the canopy cover (fc) estimated by Sentinel-2 imagery into AquaCrop

M5 irricrop (tested in Southern italy)

ITALIAN CASE STUDY

M5 :Evaluation

2017

2018

Cumulated irrigation water requirement (mm) estimated by:

- AquaCrop
- IRRISAT
- Assimilation of fc retrieved by Sentinel-2 imagery into AquaCrop
- Observed schedule

Dalla Marta et al. Agronomy 2019

M5 Irricrop evaluation

		Yield (t/ha)	Tr (mm)	E (mm)	ET (mm)	IWR (mm)	WP _{IWR} (kg/m ³)
2017	Observed	7.20				416	1.73
	IRRISAT				450	450	
	AquaCrop	7.23	345	192	537	461	1.57
	Assimilation	8.23	372	165	537	461	1.79
2018	Observed	7.35				402	1.82
	IRRISAT				349	298	
	AquaCrop	7.60	291	137	428	332	2.29
	Assimilation	7.34	273	139	412	317	2.31

Crop and water balance variables

(Tr: crop transpiration, E: soil evaporation, ET: evapotranspiration, IWR: irrigation water requirement, WP_{IWR}: irrigation water requirement productivity).

Conceptualization of practical service models in line with the farmers needs

- ▶ The aim was propose, define, optimize and customize irrigations advisory services, provided by OPERA.

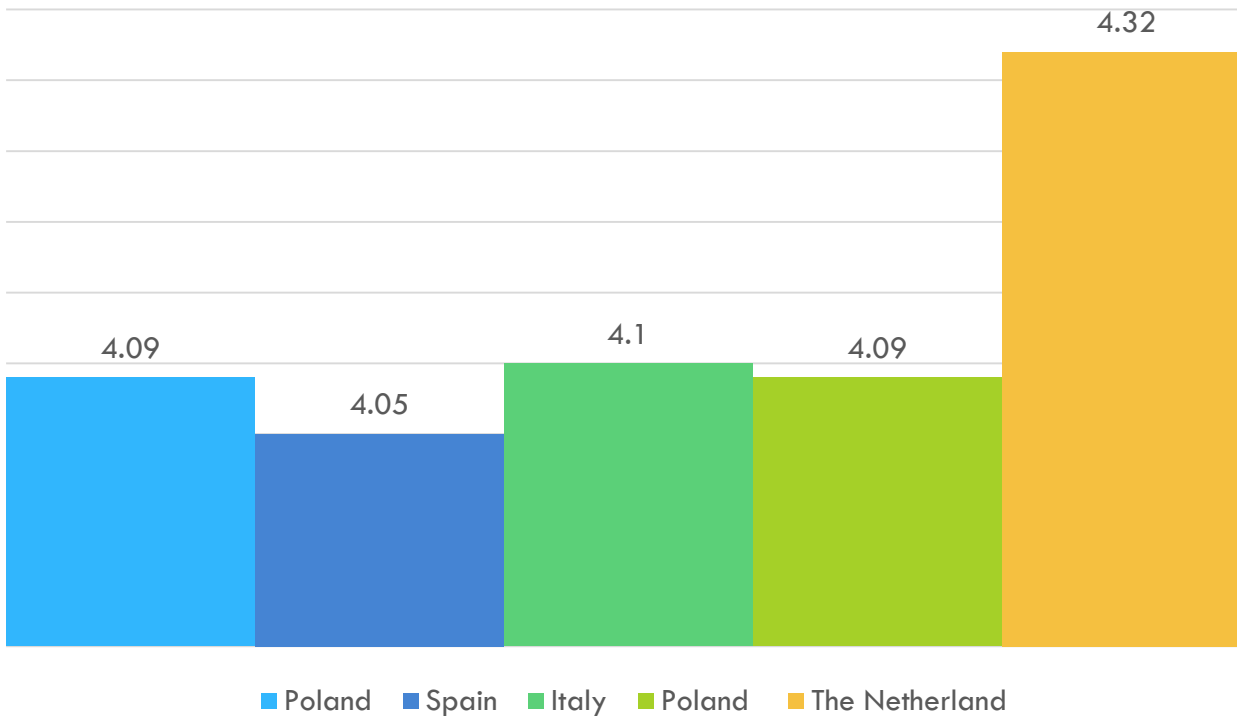

Two main approaches :

- ▶ The choice experiment to determine the preferences of farmers regarding the main characteristics and attributes of IASs. Among these, **price** allows an estimation of the trade-offs between attributes in monetary terms, thanks to marginal “willingness to pay” (WTP)
- ▶ SWOT analysis

Choice experiment

Attributes	Variants
Weather forecasts.	Weather forecasts with a time horizon of up to 5 days.
Contract. It indicates the adoption of IAS for a range of time and for each farm.	for entire crop cycle, one or three years
Crop Water Requirement. It indicates a range of forecasting.	range of forecasting for 1, 2 or 3 days
Crop monitoring. A satellite image (i.e. Vegetation response to environmental stresses) of your plots.	every per day, 10 ,15 days
Registration of irrigation. Indicates recording the dates and the volumetric water applied.	one time, two times or three per month
Price (/ha/y)	5 – 10 – 15 €

Choice experiment results

Weather forecast :Willing to pay (€/d)

SWOT

Strengths

- Water saving
- Cost reduction
- ...

Threats

- Social aspect and education
- lack of funding, institutional mechanisms to link rural communities

Weakness

- They face a lack of funds
- Low levels of diffusion of the information at farm level
- ...

Opportunities

- improving agricultural production
- increase the water management troughs the ICT
- ...

General Conclusions

- ▶ **Integration** : sharing methodology at both end of the process (needs and market analysis) => a broader vision of needs thanks to the different pilot area contexts.
- ▶ **Integration** in the way of describing the innovation and method to evaluate IAs.
- ▶ **Timely** to continue development using technological opportunities (Sentinel, ensemble forecast, crop models)
- ▶ **Diversity** of implementations but **similarities** in approaches → strengthen conclusions
- ▶ **FACCE /Water** : Irrigation at the intersection of climate change (adaptation) and water management (water use efficiency, water resources)
- ▶ **Management** of the project satisfactory (2 steps, expected length of the document, link with national agencies). Improvements (format of the report known at the submission level).

General Conclusions

For the future

Farmers trust in IAs remains the key issue : Need of dedicated experiment where advices are really tested in the field

- need to focus effort on an experimental set up to analyse impacts on **both** water saving and the vegetation production and evaluate models in their ability to represent water/production interactions accurately
- appropriate infrastructure, long term perspective → Format of the projects

Thank you

Acknowledgement

“The authors would like to thank the EU and The Ministry of Economic Affairs (The Netherlands), CDTI (Spain), MINECO (Spain), ANR (France), MIUR (Italy), NCBR (Poland) and WRC (South Africa) for funding, in the frame of the collaborative international consortium OPERA financed under the ERA-NET Cofund WaterWorks2015 Call. This ERA-NET is an integral part of the 2016 Joint Activities developed by the Water Challenges for a Changing World Joint Programme Initiative (Water JPI).”

Funding

SWOT External parameters

Threats

- Social aspect and education
- lack of funding, institutional mechanisms to link rural communities

Opportunities

- improving agricultural production
- increase the water management troughs the ICT
- new markets and consumers
- reducing the environmental pollution.

SWOT Internal parameters

Strengths

- Water saving
- Cost reduction
- ...Capacity and competence
- Good network of land reclamation and irrigation consortia
- Innovation development
- Provide water measurements

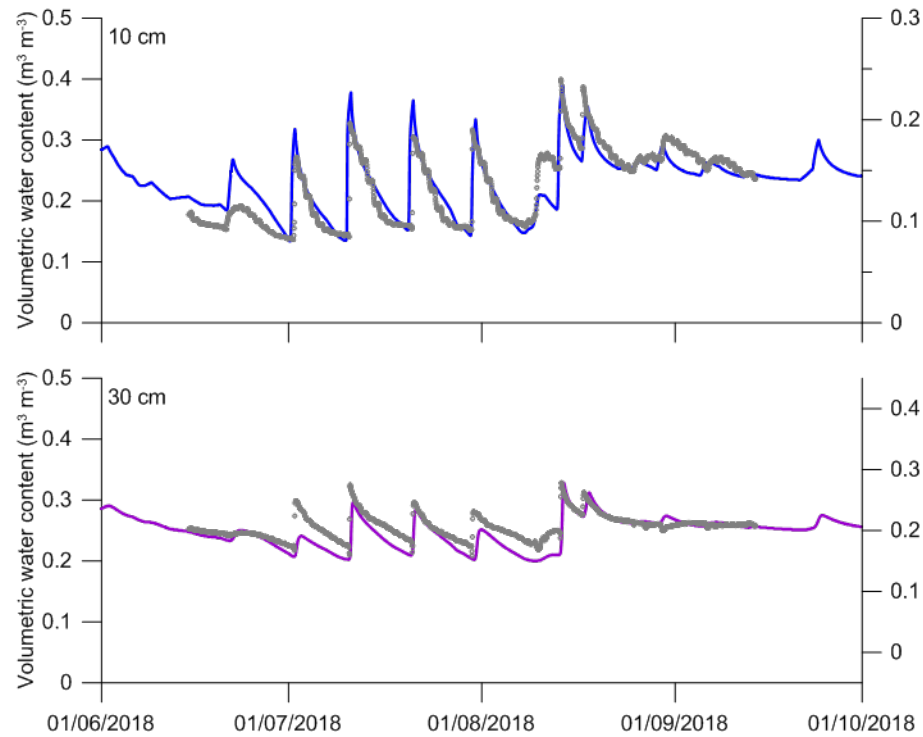

Weakness

- They face a lack of funds
- Low levels of diffusion of the information at farm level
- Negative perception of information provides by IASs
- Low use of electronic devices among farmers of sharing knowledge provide from IASs.

M3 :APSoMoCo modelling soil moisture with ensemble forecast

- Simulation model (SWAP-WOFOST)
 - history: true weather
 - future 15 d: ensemble (51) weather forecast
- Prediction + uncertainty of water content in root zone
- Automation
 - download ECMWF data, download historic KNMI weather data, download sensor data
 - run SWAP-WOFOST for all scenarios
 - Produce graphs (and send these by E-mail)

SWAP-WOFOST implementation evaluation

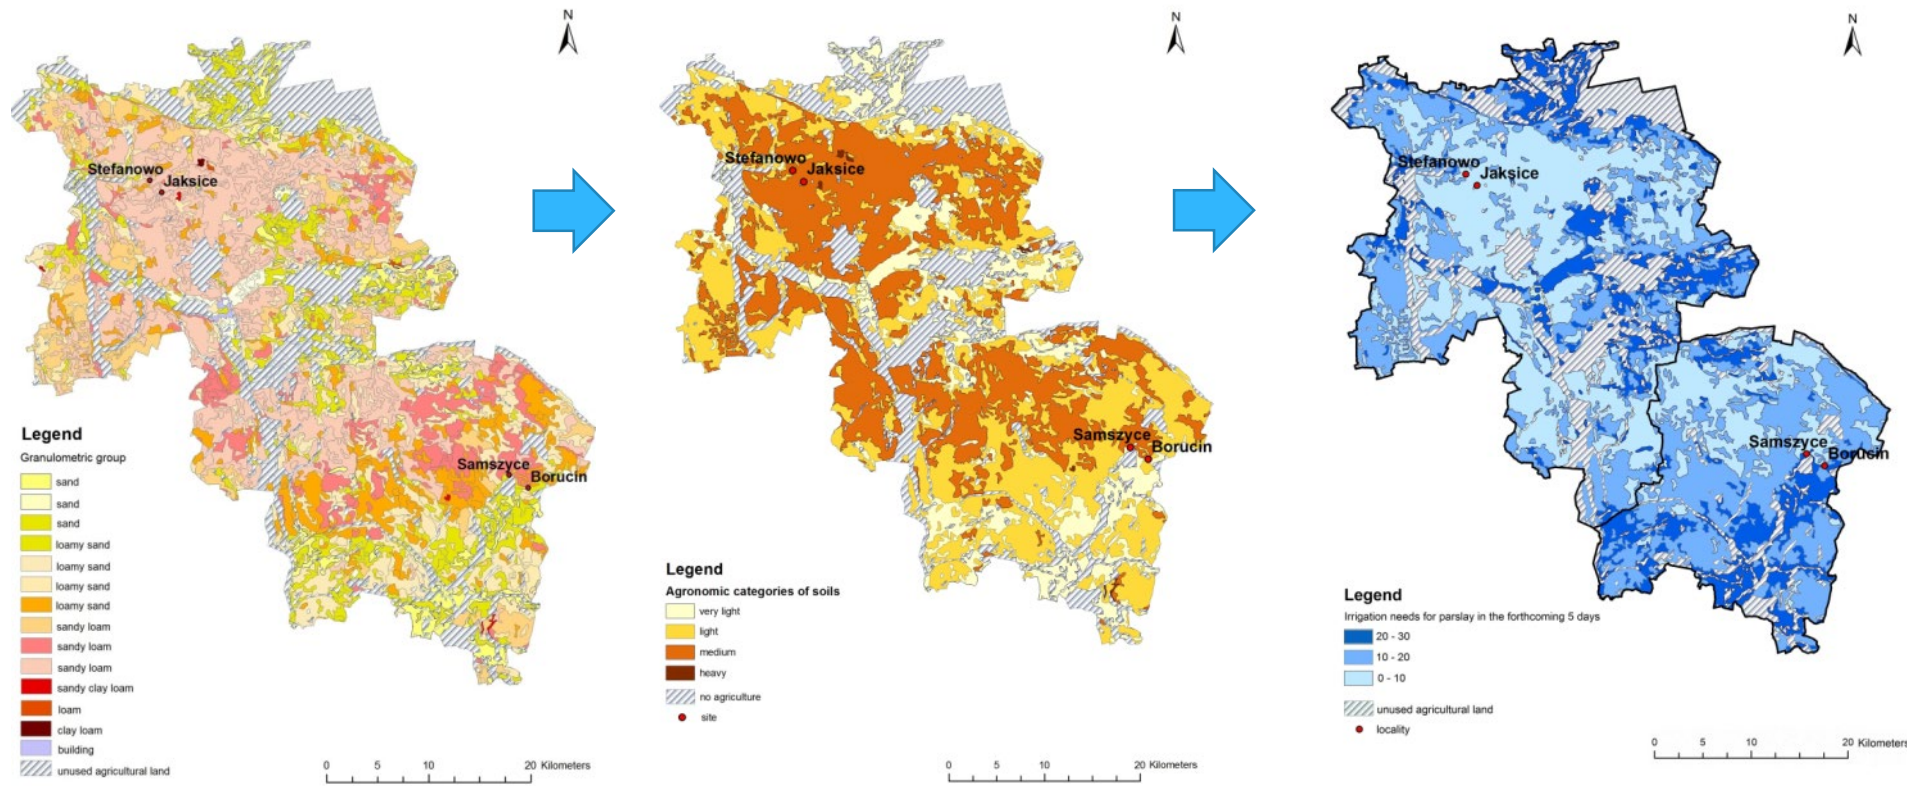

M3 Hindcast Analysis

M4 Croplrr : advisory given at the regional level

Upscaling from field scale to region scale based on soil-agricultural maps, modeling and GIS techniques.

Elaboration of maps: T. Bolewski, E. Kanecka-Geszke (ITP KOB)
based on the maps of the Institute of Soil Science and Plant Cultivation (IUNG)

Conclusions

- ▶ Our results show that farmers are actually willing to pay to introduce an irrigation support system that results in an economic advantage over their current situation.
- ▶ It has been shown that farmers' willingness to pay varies according to the attributes that characterize the service offered based on the country of origin.
- ▶ Implicit prices estimates enabled us to measure the non-market benefits that would arise from an improvement in the water use efficiency and productivity.
